

Mature storage technologies: 2025 capex baseline

All values in USD2024; every row converted at the ECB annual rate of its stated price year and inflated with US CPI-U. Bracketed numbers refer to build/sources.md. Observed storage points are total project cost divided by energy (left) or power (right) capacity; the duration in the label is typical for the technology; rows are ordered by it within each group. The H2 store is a pressurised tank priced per kWh of electricity out (tank cost / SOFC efficiency); salt caverns would be ~20x cheaper per kWh where geology allows.
